

Eurolook Transparent Roller Shutter

Applications

High security commercial sites. The shutter is suited to shops, banks, museums and similar premises where both security and transparency are essential. The shutter offers a maximum surface area of 50m² mounted externally, and 72m² internally.

Key Benefits:

See through vision & quality

The transparent armour of the Eurolook®- Standard is crystal clear, offers a transparency of 83%, and allows 92% daylight transmission. Because the Eurolook® Standard is UV-stabilised, it does not dis-colour or yellow, remaining crystal clear for many years.

High Security

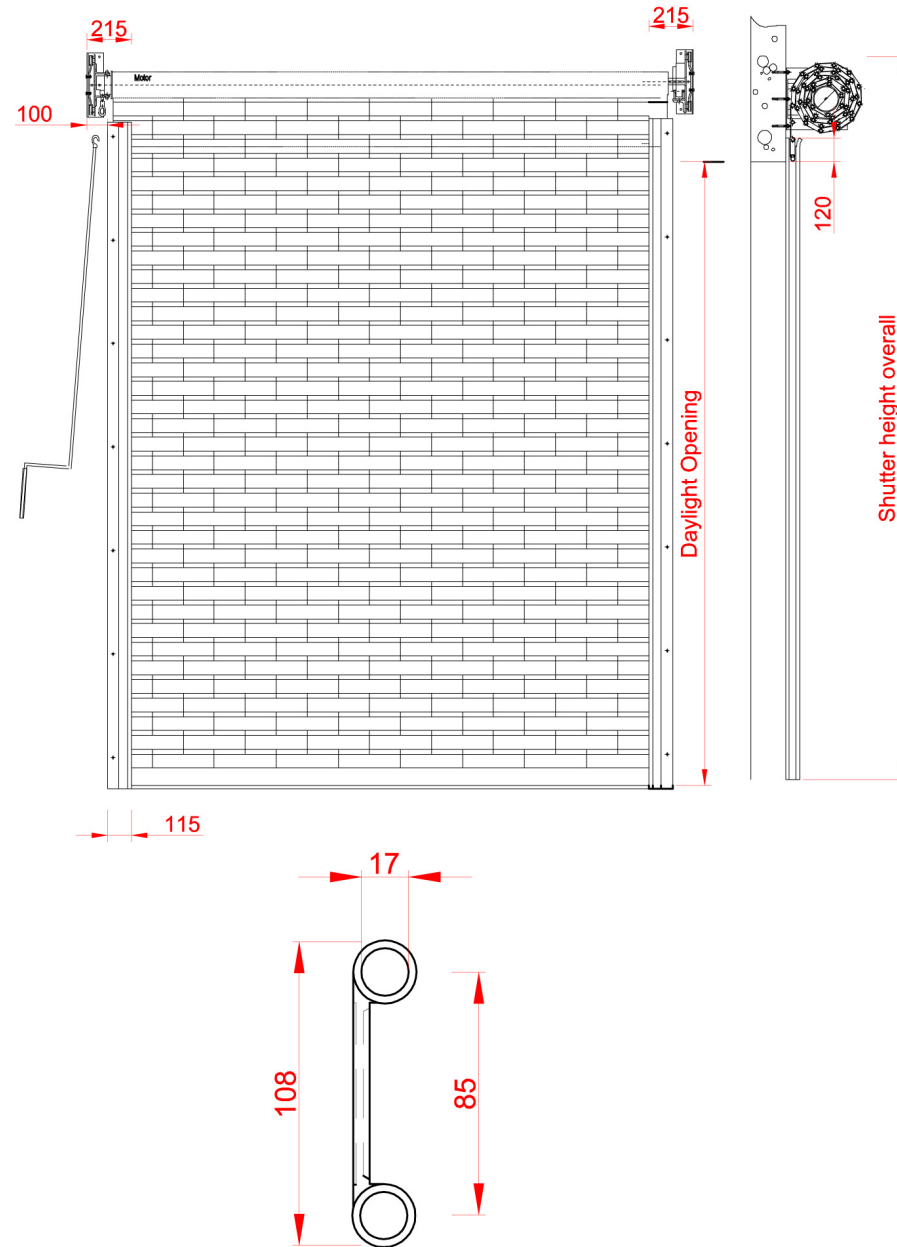

The Eurolook®-Standard armour is made of synthetic links of polycarbonate. These links are built in brick formation making it extremely secure with a maximum of flexibility. Eurolook® Standard can bend but cannot crack or break, and is the only transparent façade shutter in Europe that has obtained the SKG Class 3 security rating against the strict European standards ENV 1627-1630.

Fire Retardant

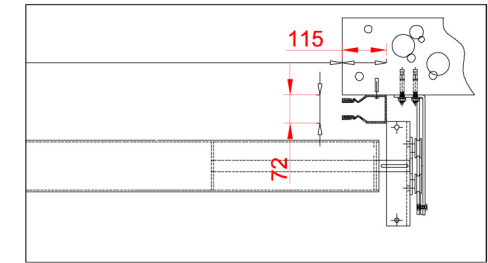

Eurolook® shutters have been tested to BS 476: Part 7 (1997), respecting the spread of flame across the surface of a material, achieving the highest possible Class 1 rating. The shutter has also been awarded a Pass according to the Aerospace safety standard ABD0031 applicable to smoke and toxic gas emissions.

Product Versatility

Eurolook® shutters are available in many forms and the standard system can be upgraded to classification as Ramraid resistant. The shutter guide channels and bottom slat can be powder coated any RAL colour and there are mini-links for smaller areas. Eurolook®- Standard is available in transparent, frosted and ventilated variants, as well as in a transparent version with a coating against scratches and graffiti.
